Education

University of Michigan

Ann Arbor, MI

Bachelor of Science in Computer Science

August 2022 – May 2026

- **GPA:** 3.88/4.00 | **Awards:** James B. Angell Scholar, William J. Branstrom Prize, University Honors
- **Relevant Courses:** Advanced Operating Systems, Operating Systems Research, Distributed Systems, System Design of a Search Engine, Computer Architecture, Theory of Computation

Technical Skills

Languages: C++, C, Go, Python, Bash | **Technologies:** Linux, POSIX, TCP/IP, Boost, io_uring, GDB, QEMU, perf, Git

Experience

Citadel

New York, NY

Incoming Software Engineer Intern

Summer 2026

EECS 482/491 Staff

University of Michigan

Instructional Assistant

August 2025 – Present

- Instructional assistant for EECS 482: Intro to Operating Systems and EECS 491: Intro to Distributed Systems
- Mentor students on concurrency, IPC, scheduling, virtual memory, file systems, Paxos consensus, and replication

Ordered Systems Lab

University of Michigan

Research Assistant (Advisor: Prof. Ryan Huang)

August 2025 – Present

- Assisted PhD mentor Yuxuan Jiang in developing CIRDAN, an LLM-based debugging agent using tree-of-thought hypothesis exploration to diagnose distributed system failures; achieved 64% file and 25% line coverage on DSD-BENCH
- Benchmarked asynchronous I/O libraries (libaio, liburing) with RocksDB, analyzing throughput, latency, and CPU utilization across varying queue depths and workload patterns

Apple (Core OS)

Cupertino, CA

Software Engineer Intern – Storage Technologies

May 2025 – August 2025

- Introduced a new tool that fakes driver architecture and enables user-space testing of kernel storage drivers
- Designed and implemented a fake storage device, automatic driver matching, and a mock infrastructure in C++
- Utilized newly supported tool to increase code coverage by over 80% and expose 15-year-old bug in XNU kernel

Qumulo

Seattle, WA

Software Engineer Intern – Cloud Read Cache

January 2025 – April 2025

- Cut minimum cluster cost by 33% by designing and deploying single-node clusters with disk-level fault tolerance
- Built automated performance testing for AWS/Azure to benchmark single-node vs. multi-node cluster performance
- Implemented index caching metrics (hits, misses, gap-fills) and I/O tracking to optimize read path efficiency
- Led read cache DKV system upgrade with safe key remapping, quorum barriers, and RPC-based shard coordination

Projects

Sharded Key/Value Service with Paxos Groups

- Built a fault-tolerant, sharded key/value store in Go with dynamic shard migration across Paxos-replicated groups. Implemented a shard master for configuration management and load balancing, atomic two-phase shard handoff during reconfiguration, and duplicate request detection with bounded memory. Ensured linearizability across configuration changes using coordinated log entries.

Multi-threaded Network File Server

- Built a concurrent, crash-consistent network file server in C++ with TCP socket communication, supporting multiple simultaneous users with nested directories. Implemented fine-grained reader-writer locking with hand-over-hand traversal for safe concurrent access, and ensured crash consistency through ordered disk writes that maintain valid metadata invariants.

Virtual Memory Pager

- Designed a demand-paged virtual memory system in C++ supporting multiple processes with swap-backed and file-backed pages. Implemented copy-on-write optimization for fork(), clock page replacement with eager swap reservation, and efficient fault handling with deferred work to minimize disk I/O and page copies.

Thread Library

- Developed a preemptive, kernel-level thread library in C++ supporting multiple CPUs with timer interrupts. Implemented context switching via ucontext, synchronization primitives (mutexes, condition variables) with proper interrupt management, and FIFO scheduling with CPU suspend/resume for efficient resource utilization.

Other
